Tip 1: Embrace YOLO Mode

Trust AI to generate working code from your intent.

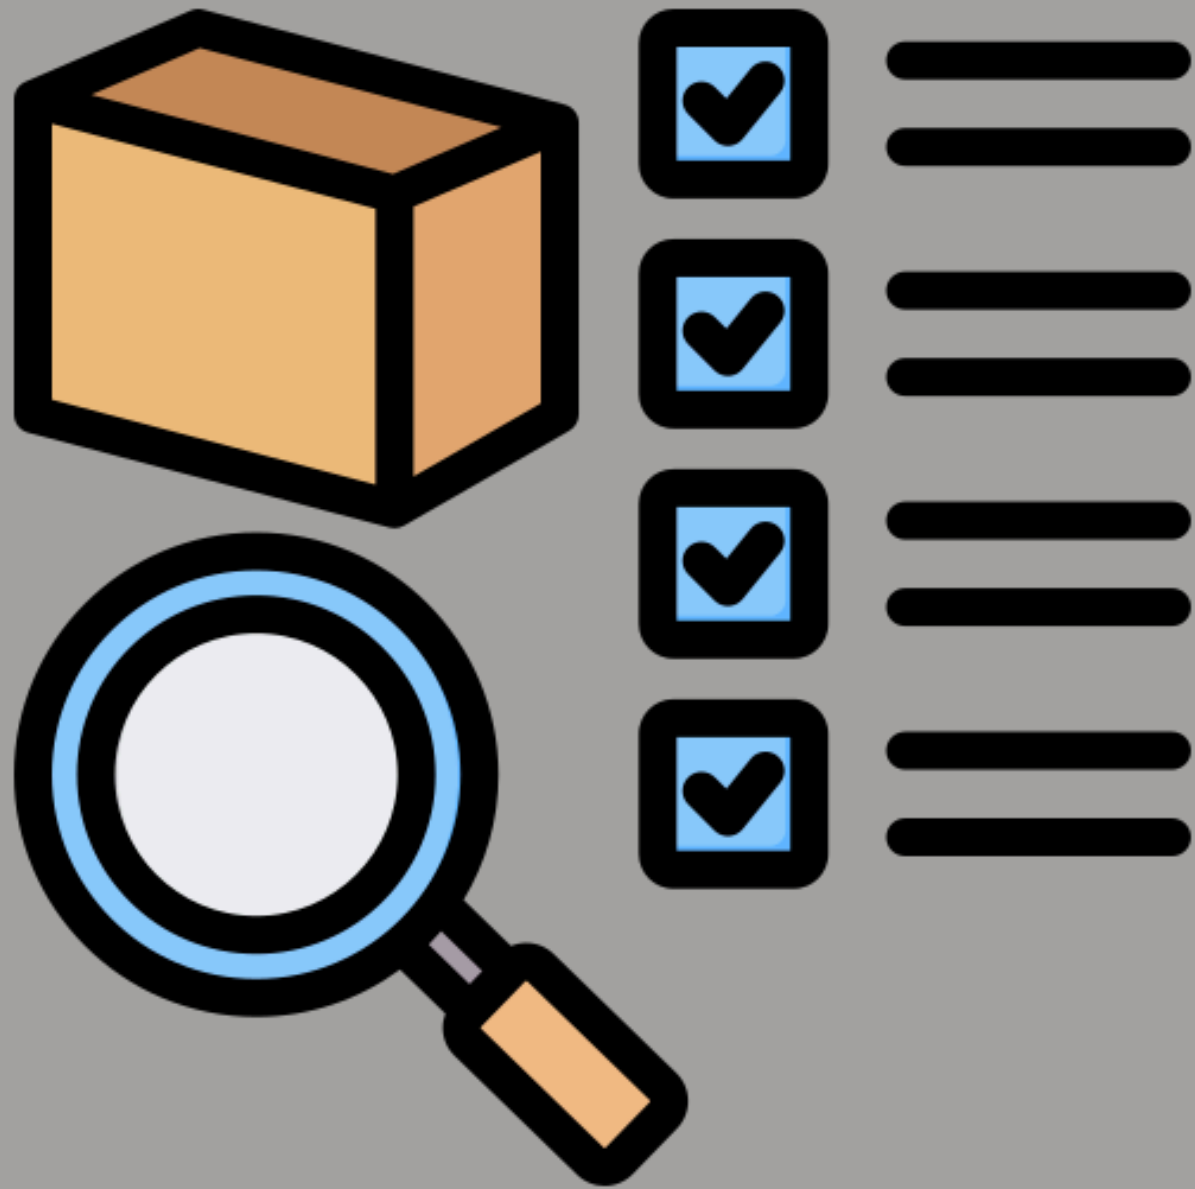

Let go of early control to move fast.

Note:

Set up an allowlist and a blocklist to balance freedom and safety.

Tip 2:

Write a Detailed Product Spec.

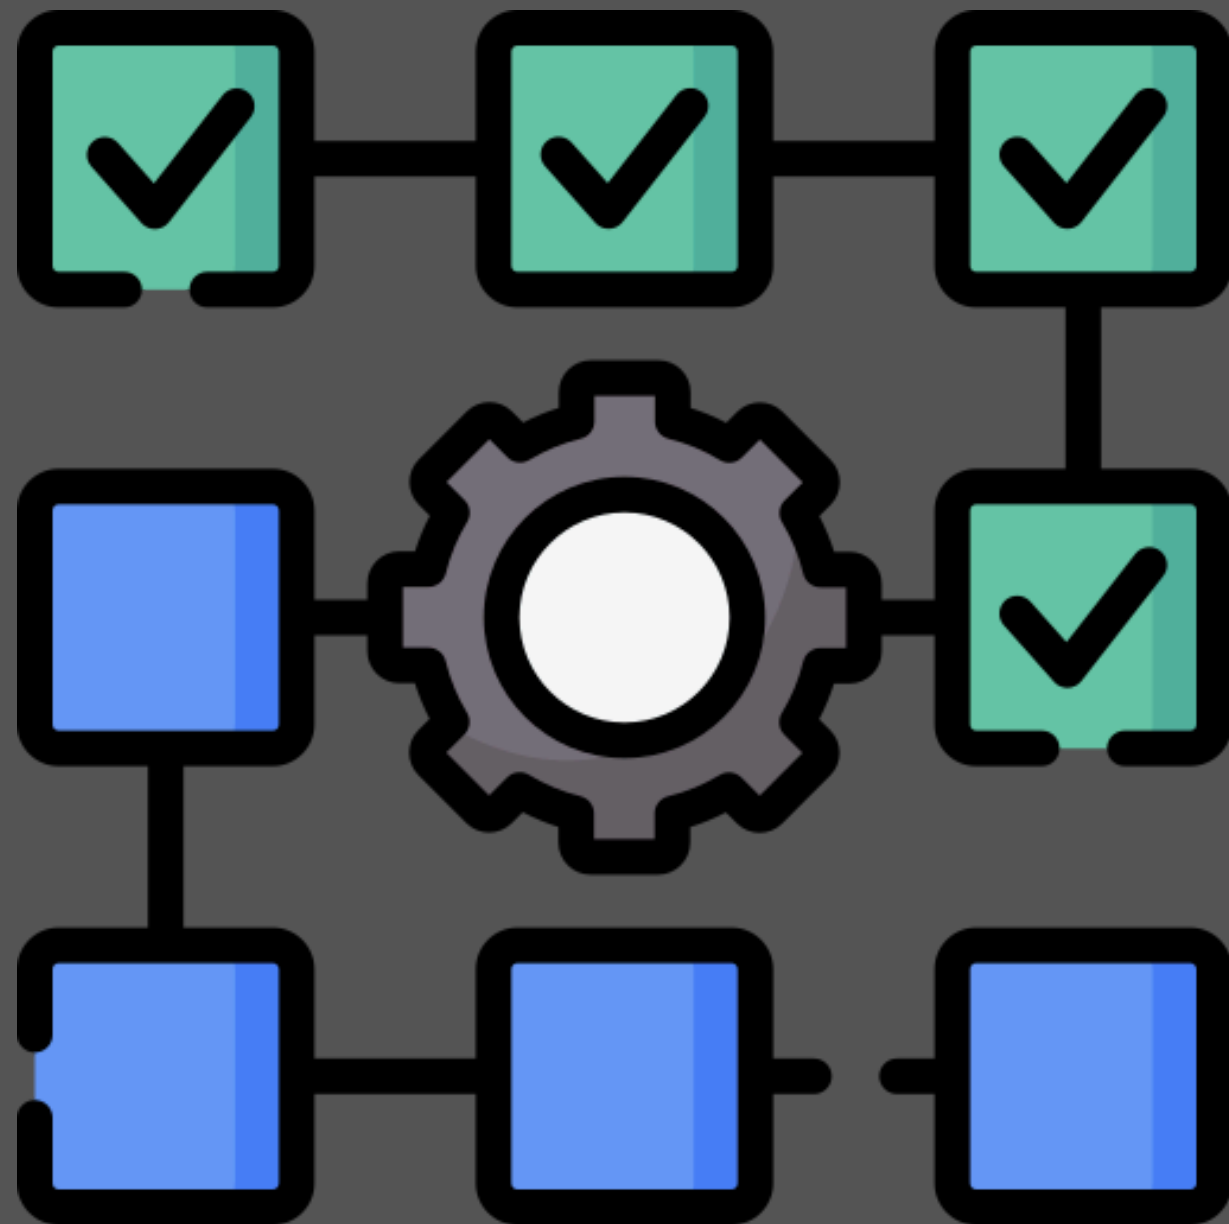

Use divide and conquer :
Split vision into small,
well-scoped tasks.

Clearly define file scope for
precise AI edits.

Note:

Update spec. as you go.
Name key unit so AI can
reference them consistently.

Tip 3: Step-by-Step Changes + Unit Tests

Ask AI for incremental changes

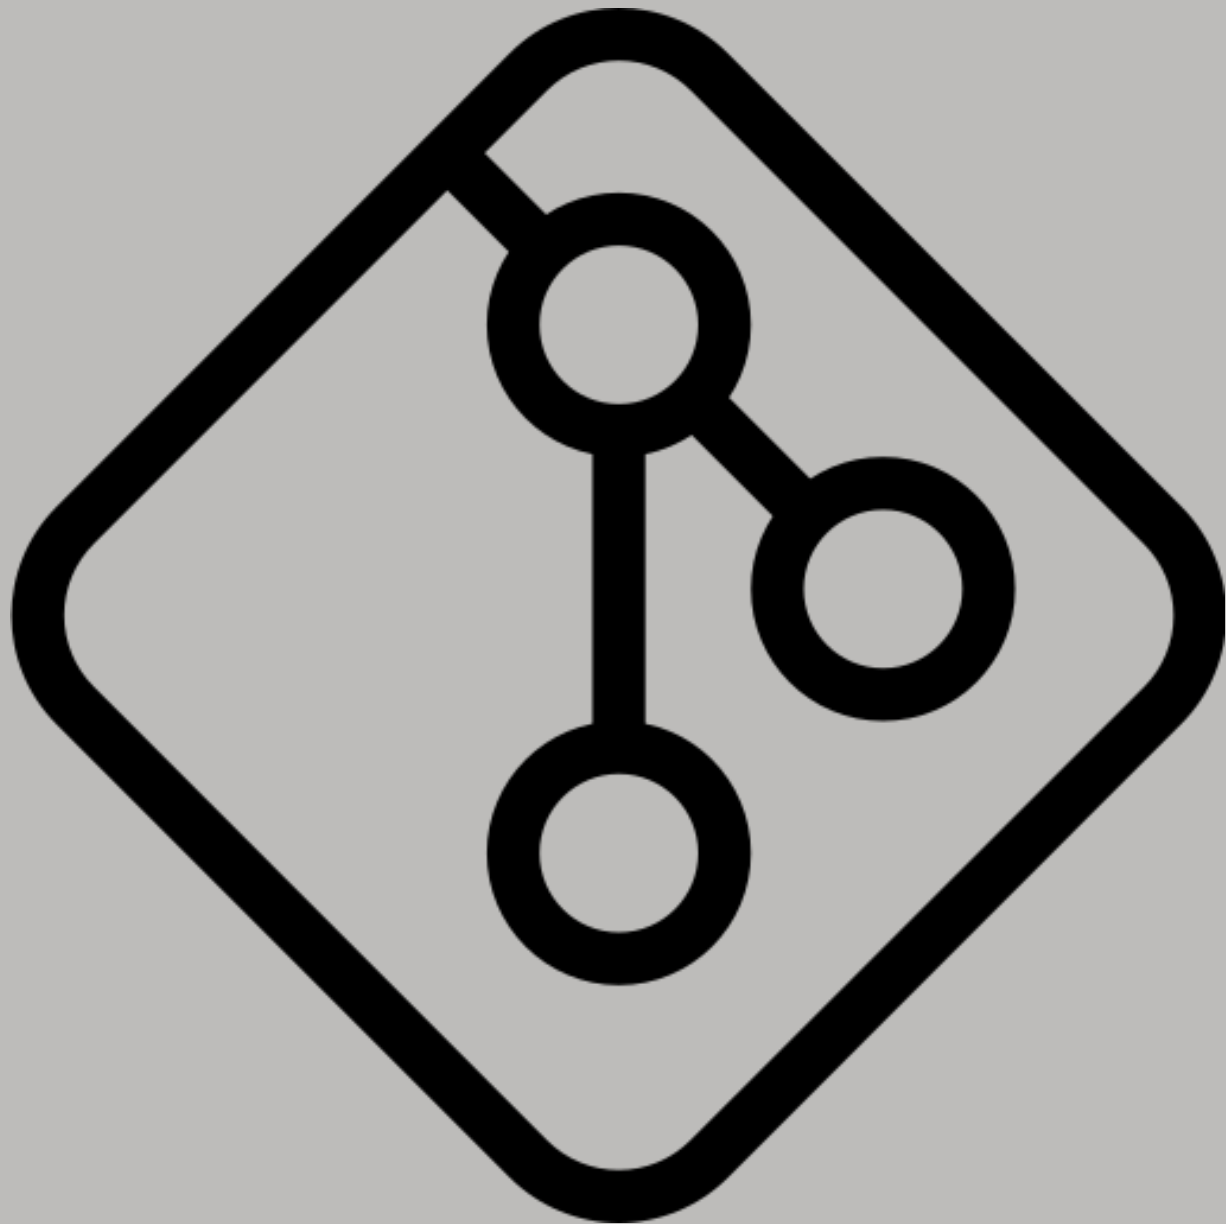

Request unit tests to
validate new features

Note:

**Catch issues early and
ensures changes don't
break existing logic.**

Tip 4: Use Git for Safe Progress

**Version control
==
Peace of mind**

**Commit good versions
regularly.**

**Let AI experiment freely
without risking stable code.**

**Note:
Always allows safe rollback
or branching.**

**Thank You for Your
Attention!**

**Let AI help you vibe, build,
and iterate faster.**
